- Motivation
- Prior Work
- Planning with Clearance Values
- Abstraction and Hierarchical Planning
- Results
- Conclusion

Path planning literature is full of assumptions...
That don't always hold in reality!

Knowledge engineering challenges:

- Identifying relevant domain-specific information.
- Extracting it automatically.
- Exploiting it to guide search.

Application areas:

- Video games.
- GPS systems.
- Any path planning system with heterogeneous agents.

GPS Fail

- TA*/TRA* [Demyen & Buro, 2006]
- **CMM [Geraerts & Overmars, 2007]**

Clearance Annotations

Intuition: Calculate size of maximum traversable area at each octile (clearance value).

Results (toymap)

Clearance values for different capabilities:

3	3	3	3	4	3	2	1	1	1
3	2	2	2	3	3	2	1	1	1
2	2	1	1	3	3	2	2	2	1
2	1	1	1	2	2	2	1	1	1
2	1	1	1	1	2	1	1	1	1
2	1	1	1	1	1	1	1	1	1
3	2	1	1	1	1	1	1	1	1
3	3	2	1	1	3	3	2	1	1
2	2	2	2	2	2	2	2	2	1
1	1	1	1	1	1	1	1	1	1

Ground

2	2	2	2	2	2	2	2	2	1
1	1	1	1	1	1	1	1	1	1

Ground or Trees

Space complexity: $|CV| = (|V| - |V_{HO}|) \times 2^{r-1}$

Compute on demand!

Annotated A*

Search process:

- Similar to A*.
- Extra parameters: Agent's size and capability.
- Only expand nodes with clearance $>$ agent size.

Pros:

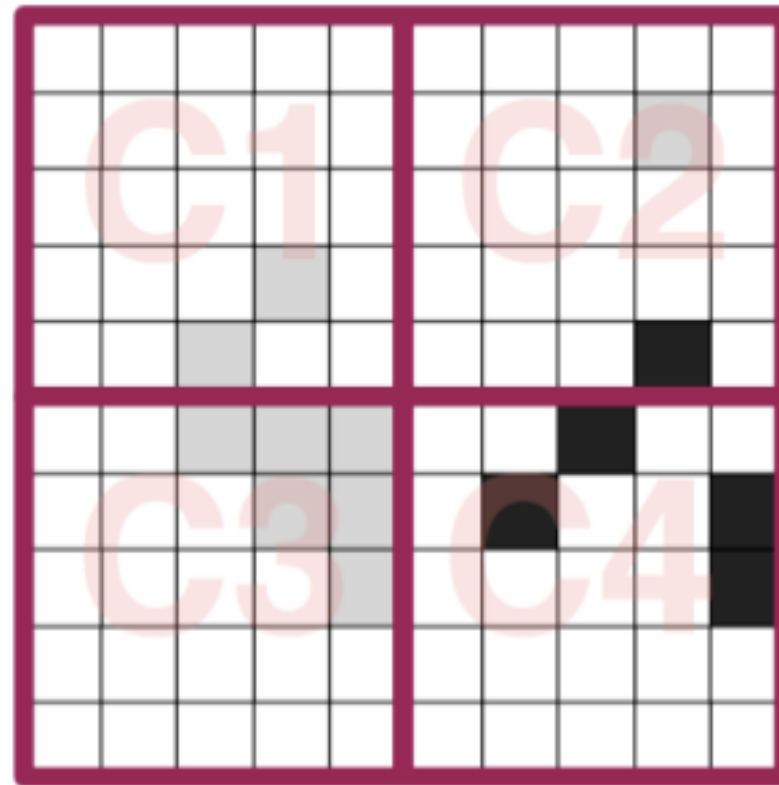

- Works great!

Cons:

- For small problem sizes...

Abstraction

Intuition: Use hierarchical search. Apply cluster-based abstraction as per [Botea et al, 2004]

5x5 Clusters

Inter-cluster Transitions

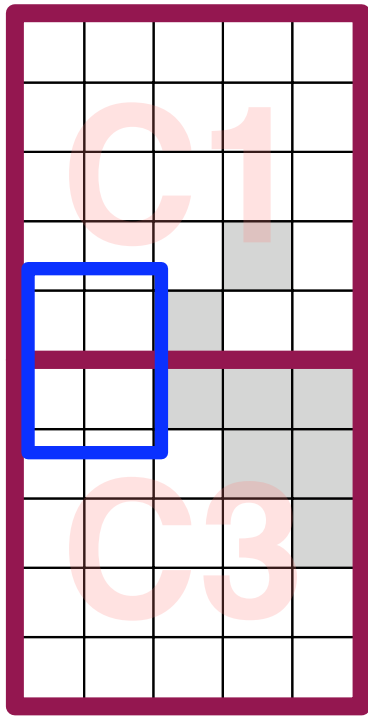

Approach: Build abstract graph by finding all entrances between clusters.

Identify entrances

Inter-cluster Transitions

Approach: Build abstract graph by finding all entrances between clusters.

Identify entrances

Inter-cluster Transitions

Approach: Build abstract graph by finding all entrances between clusters.

Identify entrances

Inter-cluster Transitions

Approach: Build abstract graph by finding all entrances between clusters.

Identify entrances

Inter-cluster Transitions

Approach: Build abstract graph by finding all entrances between clusters.

Identify entrances

Identify transition points

Inter-cluster Transitions

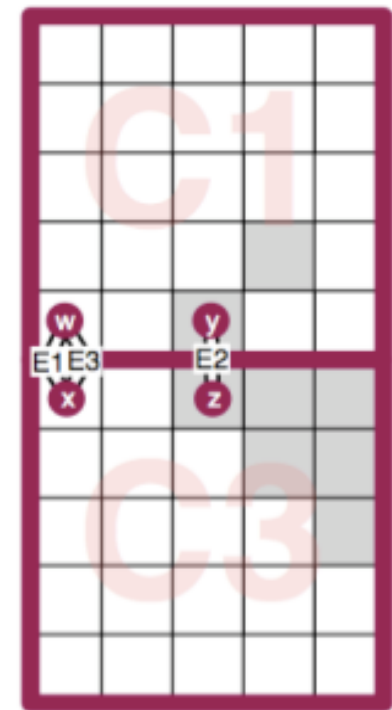

Approach: Build abstract graph by finding all entrances between clusters.

Identify entrances

Identify transition points

Final result

Intra-cluster Transitions

Approach: Use AA* to find all paths between each pair of nodes inside a cluster.

Edge Annotations

{Terrain, Clearance}:

E1 = {Ground, 2}

E2 = {Ground, 1}

E3 = {Ground \vee Trees, 2}

E4 = {Ground \vee Trees, 2}

E5 = {Ground \vee Trees, 1}

E6 = {Ground \vee Trees, 1}

If a path exists, add a new intra-edge edge to abstract graph; annotated with the capability and size parameters used by AA*

Compacting the abstract graph

Method produces a representationally complete graph but can get rather large.

Solutions:

- Strong dominance
- Weak dominance.

Strong dominance example

Intuition: Retain paths with larger clearance, all else being equal.

Edge Annotations

{Terrain, Clearance}:

E1 = {Ground, 2}

E2 = {Ground, 1}

E3 = {Ground \vee Trees, 2}

E4 = {Ground \vee Trees, 2}

E5 = {Ground \vee Trees, 1}

E6 = {Ground \vee Trees, 1}

Result: High quality abstraction.

Strong dominance example

Intuition: Retain paths with larger clearance, all else being equal.

Edge Annotations

{Terrain, Clearance}:

E1 = {Ground, 2}

E2 = {Ground, 1}

E3 = {Ground \vee Trees, 2}

E4 = {Ground \vee Trees, 2}

E5 = {Ground \vee Trees, 1}

E6 = {Ground \vee Trees, 1}

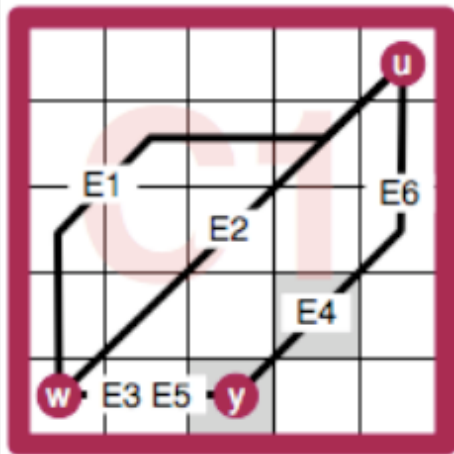

E3 \succ E5

E4 \succ E6

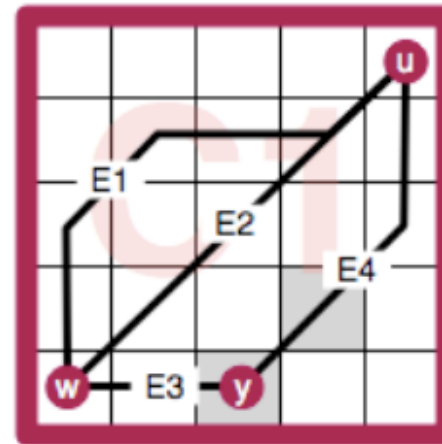

Result: High quality abstraction.

Strong dominance example

Intuition: Retain paths with larger clearance, all else being equal.

Edge Annotations
{Terrain, Clearance}:
E1 = {Ground, 2}
E2 = {Ground, 1}
E3 = {Ground \vee Trees, 2}
E4 = {Ground \vee Trees, 2}
E5 = {Ground \vee Trees, 1}
E6 = {Ground \vee Trees, 1}

Edge Annotations
{Terrain, Clearance}:
E1 = {Ground, 2}
E2 = {Ground, 1}
E3 = {Ground \vee Trees, 2}
E4 = {Ground \vee Trees, 2}

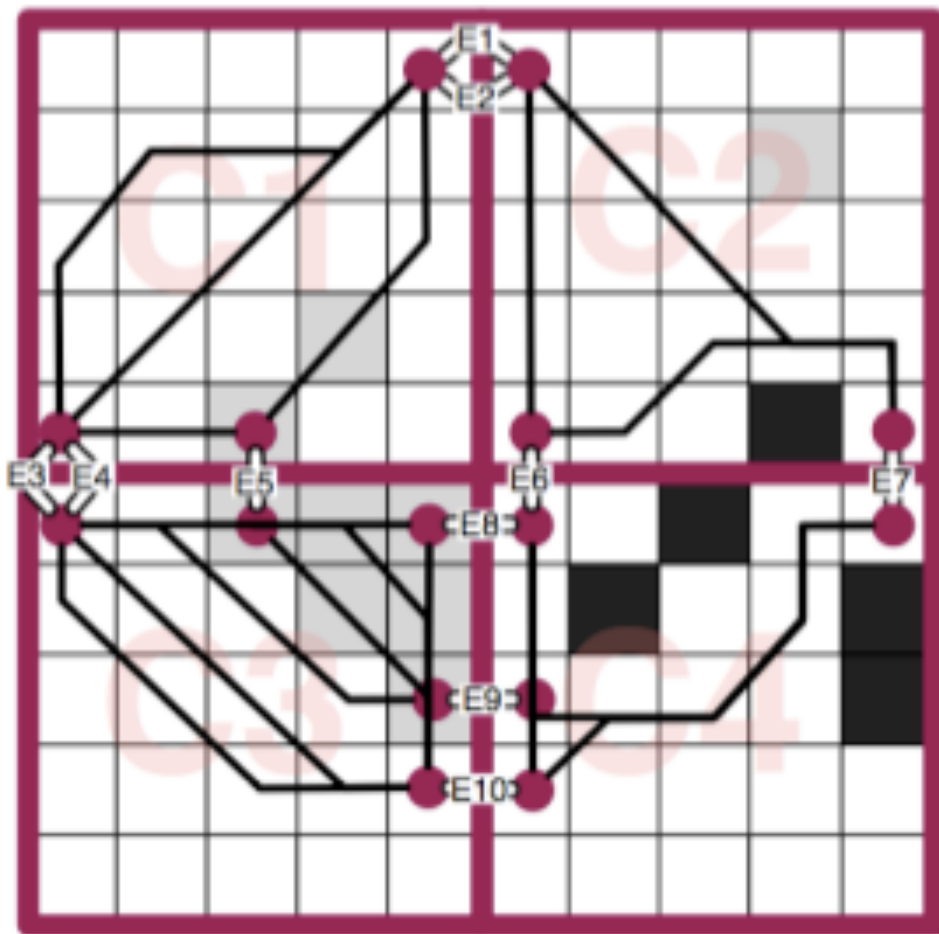

$E3 \succ E5$

$E4 \succ E6$

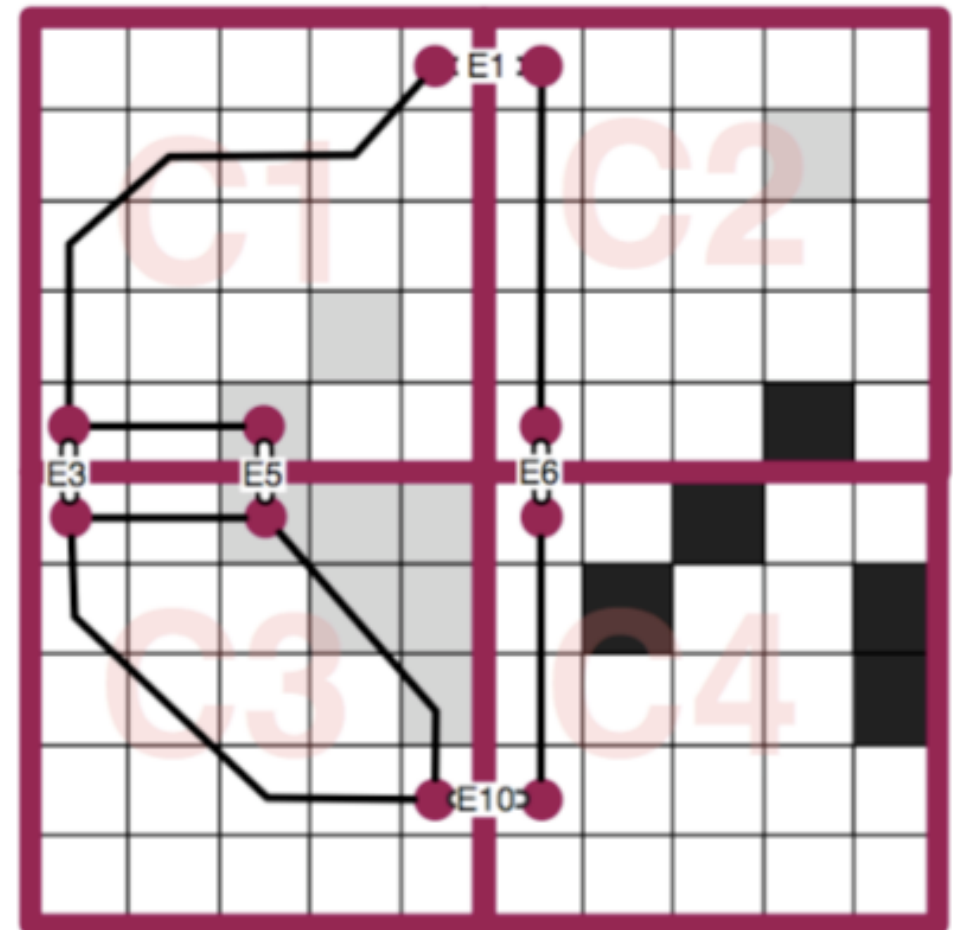

Result: High quality abstraction.

Weak dominance example

Intuition: Retain edges with large clearance traversable by many agents (freeways vs. trails)

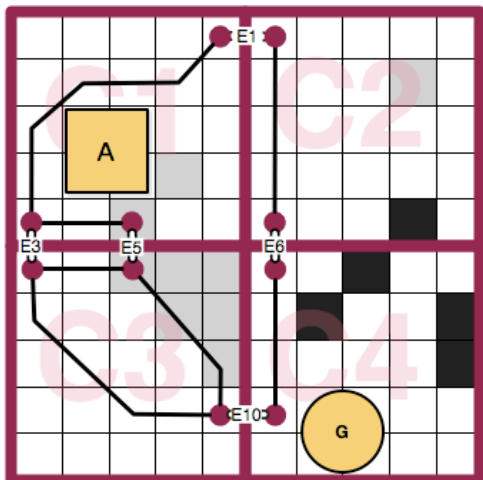

$E1 \succsim E2$ $E10 \succsim E9$ $E6 \succsim E7$
 $E3 \succsim E4$ $E10 \succsim E8$

Result: low quality abstraction

Hierarchical Annotated A*

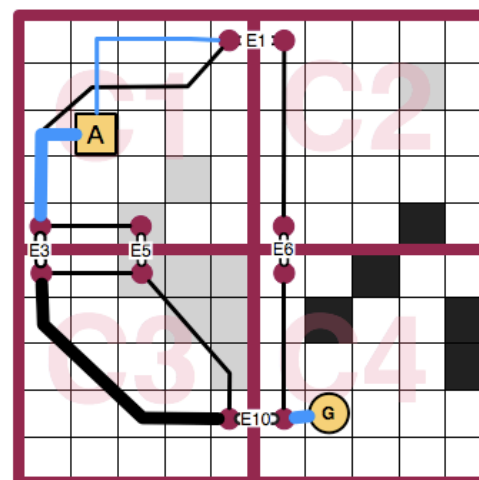

- Extends HPA* [Botea et al 2004]
 - Insert start and goal into abstract graph
 - Find a hierarchical solution
 - Refine
- AA* for insertion step.
- Hierarchical search is a variation on A*
 - Requires agent size and capability as parameters
 - Only add successors to open list if edge is traversable

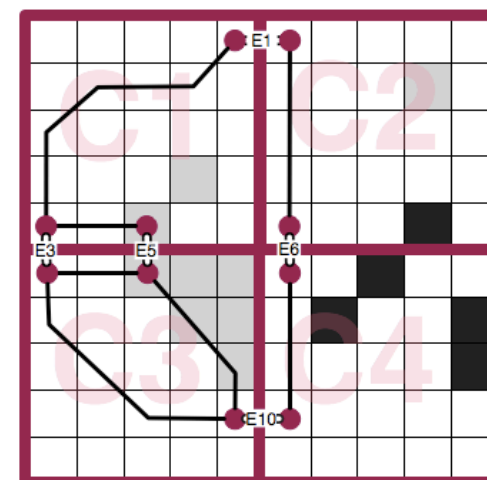

(a)

(b)

(c)

(d)

- 120 maps from Baldur's Gate.
- 3 cluster sizes (10, 15, 20)
- 5 derivative sets
 - Randomly interspersed each map with second terrain type (10%, 20%, 30%, 40% and 50%).
- 2 agent sizes (1 and 2).
- Randomly assigned capability
- 100 valid problems per map.
- Each agent size solves each problem.
- Intel Core2 Duo @ 2.4GHz w/ 1GB RAM (OSX 10.5.2)
- Implemented using Hierarchical Open Graph
- Source code at: <http://ahastar.googlecode.com>

Experiments: Graph size

Original gridmaps averaged 4469 nodes & 16420 edges.

Best case (Cluster size = 20)

	HQ	LQ
Nodes	4.0%	2.0%
Edges	5.0%	0.9%

Worst case (Cluster size = 10)

	HQ	LQ
Nodes	16.6%	15.7%
Edges	38.4%	23.6%

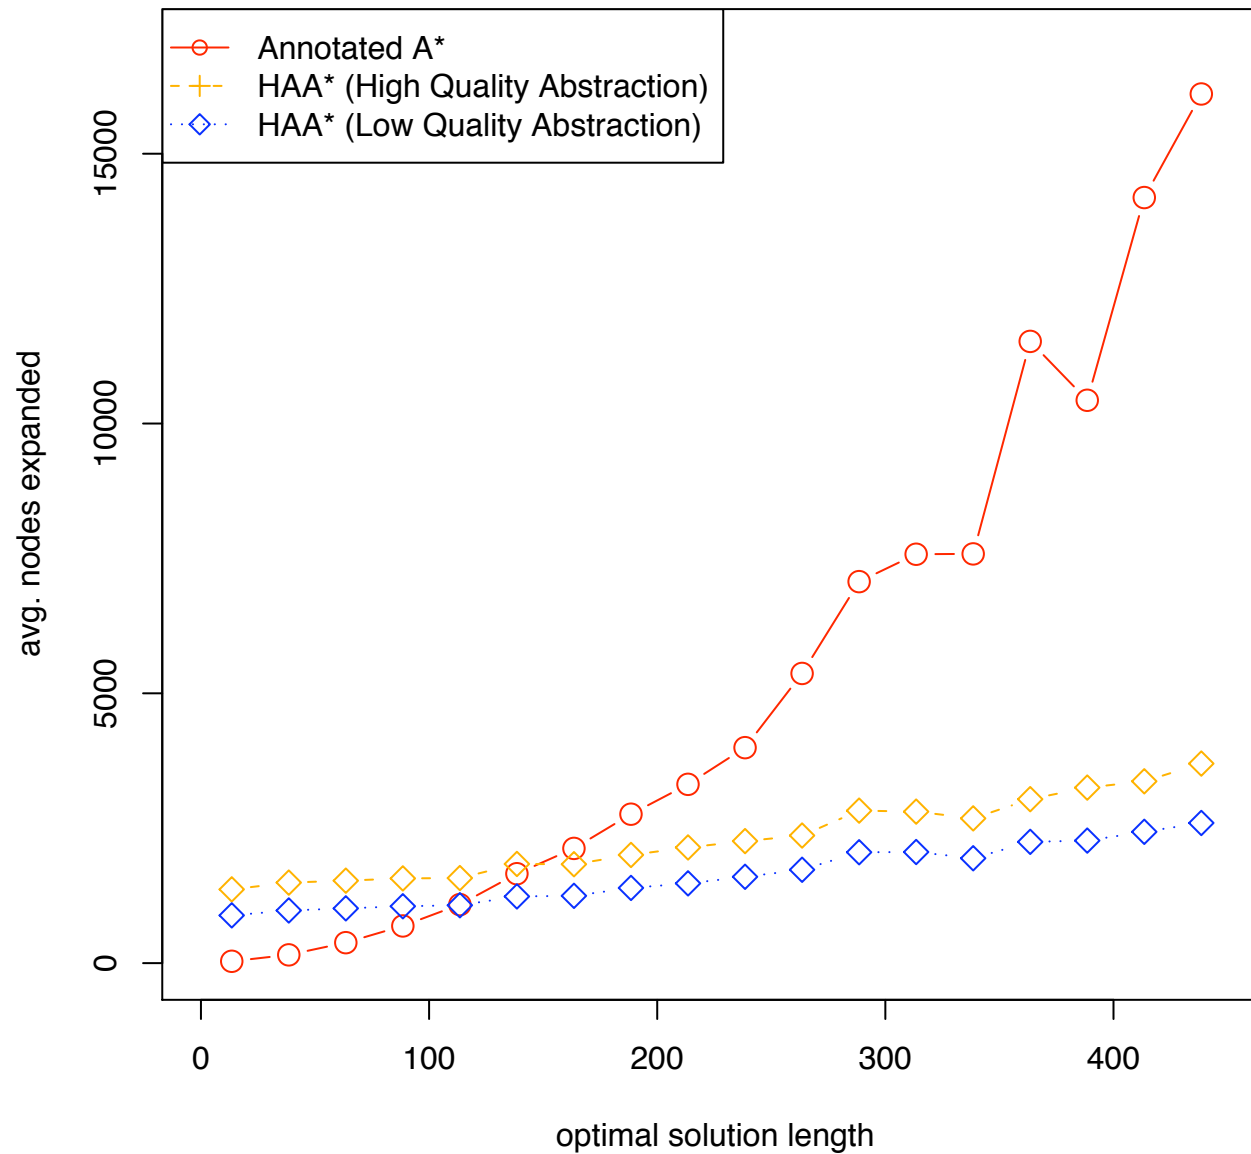

Experiments: Path quality

HAA* Path Quality (Cluster size = 15)

Experiments: Search effort

Total search effort (SO=20%, Cluster size = 15)

- Presented solutions for an overlooked but important problem in single-agent pathfinding.
 - Clearance value based pathfinding is simple and powerful.
 - Possible to build efficient hierarchical representations of complex environments.
 - Detailed empirical analysis shows method is very effective.
 - Near optimal solutions to complex problems.
 - Small memory overhead in practice.
- Future:
 - Reducing insertion effort.
 - Extend ideas to multi-agent case.
 - Apply to non-tile map encodings (like navigation meshes).
